DaTARIUS offers you the possibility to test copy-protected discs.

As piracy has become a business and a hobby, Copy Protection has become a necessity in manufacturing CD-ROMs and CD-Audios. Even for modified discs there is a need to do proper quality inspection and to secure that manufacturing is within the very tight quality limits.

Quality control is essential to the efficient and profitable operation of every replication plant. Proper testing will detect failures in production so that corrective action may be taken in a timely manner. Copy Protection's watermark may alter the physical structure of the disc. Therefore, by testing, it is vital to be able to differentiate these deliberate failures from the failures resulting from the production process.

DaTARIUS Technologies GmbH is intensively involved in the development of Copy Protection scheme and is proud to be the first company to enable test equipment to handle and check the quality of copy-protected discs.

The DaTARIUS CS-4/WIN software automatically checks the presence of the Copy Protection and then allows the testing of protected replicas, stampers and glass masters. The user can select to conceal or display the anomalies caused by Copy Protection.

The version 6.05 of the CS-4/WIN supports DADC's Key2audio™ from Sony DADC, Macrovision's SafeDisc™ and SafeAudio™ and Midbar Tech 's Cactus Data Shield™ (CDS100/200/300). This version is available in April 2002 and demonstrated on the Media-Tech Expo 2002 6-8th may in Frankfurt Hall 8 Booth 8G28.
